

## 7.1.4

### *Water conservation facilities available in the Institution*

#### **Rainwater harvesting unit:**

Rain water harvesting facility has been created to collect entire water from the terrace and feed it to a soak pit designed scientifically around a natural underground well. The total capacity is estimated at 14,06,331 liters.

## **INTRODUCTION**

One of the biggest challenges of the 21<sup>st</sup> century is to overcome the growing water shortage. Rainwater harvesting (RWH) has thus regained its importance as a valuable alternative or supplementary water resource, along with more conventional water supply technologies. Water shortages can be relieved if rainwater harvesting is practiced more widely. People collect and store rainwater in buckets, tanks, ponds and wells. This is commonly referred to as rainwater harvesting and has been practiced for centuries. Rainwater can be used for multiple purposes ranging from irrigating crops to washing, cooking and drinking.

Rainwater harvesting is a simple low-cost technique that requires minimum specific expertise or knowledge and offers many benefits. Rainwater harvesting is one of the alternative technology for delivering drinking water. In fact, through the ages, this has been a traditional way of enhancing domestic water supply.

Rainwater harvesting systems are viable options both for storing water for domestic use and for recharging groundwater aquifers.

Nature has endowed India with huge water resources. We have perennial rivers like Ganga, Brahmaputra, Yamuna, Beas and other along with their tributaries and distributaries besides in North and Eastern India, we have spring and rain fed rivers in central and peninsular India.

The major rivers among these are Godavari, Krishna, Narmada, Tapti and Kaveri. These huge potential water resources notwithstanding, we are facing a water crisis across the country. Over the years, rising population, growing industrialization and expanding agriculture have pushed up the demand for water. Monsoon is still the main hope of our agriculture.

Water conservation has become the need of the day. Rainwater harvesting is a way to capture the rainwater at the time of downpour, store that water above the ground or charge the underground water and use it later. This happens in open areas as well as in congested cities through the installation of required equipment. The collection and storage of rainwater from run-off areas such as roofs and other surfaces has been practiced since ancient times in India. It is particularly useful where water supply is inadequate.

Rainwater harvesting through rooftops is an optimistic method of water conservation and Indian government has mounted this as a part of watershed management programme.

### **ABOUT BELAGAVI**

Belgaum (also called Belagavi in Kannada, Belgaon in Marathi) is a city and a municipal corporation in Belgaum district in the state of Karnataka, India.

Belgaum is in the northwestern part of the state of Karnataka, in the southern region of India. It lies near the borders of the Indian states of Maharashtra and Goa. It is 502 km from Bangalore, 500 km Southeast of Mumbai (Bombay) and 125 km southeast of Goa.

Belgaum is located at 15.87°N 74.5°E. The city is situated in the northwestern parts of Karnataka and lies at the border of two states, Maharashtra and Goa on the Western Ghats (50 km from Goa state border). It is one of the oldest towns in the state, lying at a distance of 502 km from Bangalore; 515 km from Hyderabad and 500 km from Mumbai.

The average elevation of Belgaum is 751 metres above mean sea level (2463 feet).

Belgaum is also an important educational hub, consisting of eight engineering colleges, five medical colleges, and some dental colleges across the city and district. Visvesvaraya Technological University (VTU), the largest university of Karnataka for technical education (for BE, Mtech, MCA, MBA) is based in Belgaum. Basic degree colleges, nine polytechnic colleges and three law colleges are other educational institutions. The Karnatak Lingayat Education Society (KLE), and Karnatak Law Society (KLS), are two educational giants based in Belgaum.

From the late 1970s onwards, Belgaum began seeing a substantial increase in the number of professional education institutions. While initially this was largely in the medical and engineering fields, Belgaum today hosts institutions serving a number of other professional streams as well.

### **KLS INSTITUTE OF MANAGEMENT EDUCATION & RESEARCH (IMER)**

Karnataka law society's institute of management education and research (IMER) started its journey in 1991. IMER offers 2years full time degree in master of business administration (MBA) affiliated to Rani channamma university, Belgaum, and it is recognized by AICTE, Ministry of Human Resources Development, New Delhi and Govt of Karnataka. The beautiful campus of IMER bustles with students making the most of spacious classrooms, specialization zones, a well stacked library, computer lab, contemporary seminar hall and an excellent auditorium.

IMER is an institute with a difference where students learn to apply the science of business to the art of management. IMER has been bestowed with A++ by Business India and Dalal Street Finance journal consecutively for 3 years IMER has been awarded the best B-school award in Karnataka by Brands Academy, New Delhi.

As Head of the institution and on behalf of IMER family , I welcome you to the world of IMER.

IMER premier institute well known throughout india for importing quality Management education since 1991. Our dedicated and well experienced faculty with industry background ; a state-of -the-art infrastructure and a robust industry institute interface are the salient features of IMER.

IMER strongly believes in achieving excellence at all fronts, namely; academics, research, consultancy, placements, social outreach and overall grooming of its students. The activities at the institute are steered at creating ample opportunities for students. Such opportunities allow the students to determine, discover and learn beyond the territory of the curriculum, the classroom & the campus. We constantly encourage students to take up live projects/assignment/internships which will help them broaden their horizons; improve and augment their thought process and grow as professional.

IMER is a student driven and student centric institution where-in all the decisions are taken keeping welfare of the students in mind . Our strong alumni base of 1600 plus, who have created their own identity in their respective domains, is a testimony to this fact.

We at IMER strongly believe in creating conducive learning environment for students so that an completion of their MBA course they have abundant knowledge, huge pack of skills and right attitude with them. This is the reason we involve students in various activities like out bound traning, soft skill development workshop, industrial visits, interaction with the people form industry, management events, pre-placements training, etc., and groom them with required KSAs(Knowledge, Skills and Attitude)so that they ready to face the challenges of corporate world or their own enterprises.

Average Rainfall of Belgaum City	1064 mm in the year

## RAIN WATER HARVESTING

**Rainwater harvesting** is the accumulation and deposition of rainwater for reuse on-site, rather than allowing it to run off. Rainwater can be collected from rivers or roofs, and in many places the water collected is redirected to a deep pit (well, shaft, or borehole), a reservoir with percolation, or collected from dew or fog with nets or other tools. Its uses include water for gardens, livestock, irrigation, domestic use with proper treatment, and indoor heating for houses etc. The harvested water can also be used as drinking water, longer-term storage and for other purposes such as groundwater recharge.

Rain Water Harvesting, is an age-old system of collection of rainwater for future use. But systematic collection and recharging of ground water, is a recent development and is gaining importance as one of the most feasible and easy to implement remedy to restore the hydrological imbalance and prevent a crisis.

## SCIENCE OF WATER HARVESTING

In scientific terms, water harvesting refers to collection and storage of rainwater and also other activities aimed at harvesting surface and groundwater, prevention of losses through evaporation and seepage and all other hydrological studies and engineering inventions, aimed at conservation and efficient utilization of the limited water endowment of physiographic unit such as a watershed.

Rain is a primary source of water for all of us. There are two main techniques of rainwater harvesting:

- ❖ Storage of rainwater on surface for future use.
- ❖ Recharge to groundwater.

### ADVANTAGES OF RAINWATER HARVESTING

1. To meet the ever increasing demand for water. Water harvesting to recharge the groundwater enhances the availability of groundwater at specific place and time and thus assures a continuous and reliable access to groundwater.
2. To reduce the runoff which chokes storm drains and to avoid flooding of roads.

3. To reduce groundwater pollution and to improve the quality of groundwater through dilution when recharged to groundwater thereby providing high quality water, soft and low in minerals.
4. Provides self-sufficiency to your water supply and to supplement domestic water requirement during summer and drought conditions.
5. Reduces soil erosion in urban areas.
6. The rooftop rainwater harvesting is less expensive, easy to construct, operate and maintain.

### **NEED OF THE PROJECT – RAIN WATER HARVESTING**

Due to over population and higher usage levels of water the surface sources are being over stressed which has led to boring of tube wells at individual as well as at local government's level. The replenishment of Ground Water (GW) is drastically reduced due to paving of open areas.

Indiscriminate exploitation of GW results in lowering of Ground Water Table (GWT) rendering many bore-wells dry. To overcome this situation bore wells are drilled to greater depths. This further lowers the GWT and in some areas this leads to higher concentration of hazardous chemicals such as fluorides, nitrates and arsenic.

In rural areas also, government policies on subsidized power supply for agricultural pumps and piped water supply through bore wells are resulting into decline in GWT. The solution to all these problems is to replenish GW bodies with rainwater by manmade means.

## **ROOFTOP RAINWATER HARVESTING FOR ARTIFICIAL RECHARGE TO GROUND WATER**

Water harvesting is the deliberate collection and storage of rainwater that runs off on natural or manmade catchment areas. Catchment includes rooftops, compounds, rocky surface or hill slopes or artificially prepared impervious/ semi-pervious land surface.

The amount of water harvested depends on the frequency and intensity of rainfall, catchment characteristics, water demands and how much runoff occurs and how quickly or how easy it is for the water to infiltrate through the subsoil and percolate down to recharge the aquifers.

Moreover, in urban areas, adequate space for surface storage is not available, water levels are deep enough to accommodate additional rainwater to recharge the aquifers, rooftop and runoff rainwater harvesting is ideal solution to solve the water supply problems.

3. To reduce groundwater pollution and to improve the quality of groundwater through dilution when recharged to groundwater thereby providing high quality water, soft and low in minerals.
4. Provides self-sufficiency to your water supply and to supplement domestic water requirement during summer and drought conditions.
5. Reduces soil erosion in urban areas.
6. The rooftop rainwater harvesting is less expensive, easy to construct, operate and maintain.

### **NEED OF THE PROJECT – RAIN WATER HARVESTING**

Due to over population and higher usage levels of water the surface sources are being over stressed which has led to boring of tube wells at individual as well as at local government's level. The replenishment of Ground Water (GW) is drastically reduced due to paving of open areas.

Indiscriminate exploitation of GW results in lowering of Ground Water Table (GWT) rendering many bore-wells dry. To overcome this situation bore wells are drilled to greater depths. This further lowers the GWT and in some areas this leads to higher concentration of hazardous chemicals such as fluorides, nitrates and arsenic.

In rural areas also, government policies on subsidized power supply for agricultural pumps and piped water supply through bore wells are resulting into decline in GWT. The solution to all these problems is to replenish GW bodies with rainwater by manmade means.

## Designing a Rain Water Harvesting for the Roof Top of KLS IMER Main Building

Figure: Roof Top of Main Building of KLS IMER

Figure: Terrace Floor Plan of KLS IMER Main Building

### **Designing steps:**

The methodology for the planning and designing of Rooftop Rain Water Harvesting (RRWH) system for the main building is explained in following steps;

- The route of RCC pipe below ground is finalized with the location of intake chambers to collect the harvested water from the main buildings to discharge it in Ground Water Recharge Structure (GWRS).
- The area of main building is calculated and the planning for horizontal drain pipe on wall (HPW) or gutter at the edge of sloping roof (HGW) and vertical drain pipe on wall (VPW) is done in such a way that the VPW will discharge into one or two intake chambers depending upon the size of rooftop and location of chamber.
- In case of sloping roof the area of rooftop is increased by 20% for pitch more than 25° and 10% for less than 25°.
- The HPW, HGW and VPW are designed as per norms.
- The RCC pipes below ground are designed for the corresponding discharge and available ground slope. The size of intake chamber is selected on the basis of available ground slope.
- The rain water collected from the roof top of the main building will be discharged in to the recharge pit, part of which is collected in the tank of 5000 ltr. capacity will be reused for gardening and greenbelt development.

# RAIN WATER HARVESTING

KLS IMER Main Building

Recharge Pit

**Design & Calculation:**

**1. Roof Top Based Run Off from KLS IMER Main Building:**

Rain Water Harvesting

Potential (Q) = Roof Area (A) x Runoff Coefficient (K) x Annual Rain  
Fall (R)

Roof Area (A) of the KLS IMER Main Building = 1468.4 Sq. mtr

Runoff Coefficient (K) = 0.9

Annual Rain Fall (R) of Belgaum City = 1064 mm in the year

Rain Water Harvesting

$$\begin{aligned}\text{Potential (Q)} &= A \times K \times R \\ &= 1468.6 \times 0.9 \times 1064 \\ &= 14,06,331 \text{ Litres}\end{aligned}$$

## PROJECT COST OF RAIN WATER HARVESTING

<b>Sl. No.</b>	<b>Particulars</b>	<b>Amount</b>

N.A.Saundatti  
Society Engineer

**Extract of Resolution No. 6b of Governing Council meeting held on 11.03.2016**

**RESOLUTION NO.6b:**

Considered the letter dt.4/3/2016 of M/s. Muralidhar Construction regarding incurring additional cost above the quoted rates towards excavation and construction of well in IMER campus.

As per the remarks made by our Society Engineer, GC has resolved to sanction the additional expenditure of upto Rs. 60,000/- on top of the negotiated tender cost. Budgetary provision is as under;

Budget Head	Rain Water Harvesting
Budget allocated	4.50 lakhs
Amount Utilized	-----
Amount Committed	3.90 Lakhs
Budget Balance	0.60 lakhs
Amount for the said proposal	0.60 lakhs
Balance after said proposal	0.00 lakhs

Referred to Board of Management for information.

## Submitted Sin

- The work of digging of well in IMER Campus was entrusted to Muralidhar Contractor as per work order enclosed.
- Now the excavation work is completed up to 25' depth. The necessary brickwork, covering of well with MS Jali, etc. completed.
- The availability of water is for 10' depth in the well.
- Now the contractor has submitted RA-2 for the work executed same is verified. Corrected & forwarded herewith.
- Contractor was asked to ~~dig~~ deepen the well for another 5' depth he replied that he will deepen the well in another month's time. This reply is not considered for bill.
- The brief details of payment are as under
- Name of work: Digging of well in IMER Campus
- Authority: work order no. KES/IMER/89/231 dtd 31/7/2015
- Total cost of work: Rs 3,90,000 = 0
- Total value of work done up to RA-2: Rs 2,49,476 = 30
- Deduct value of work done up to RA-1 (Paid): Rs 65,559 = 78
- Value of work done in this RA-2: Rs 1,83,916 = 52
- Deduct SD @ 5%: Rs 9195 = 82
- Payable amount after deduction of SD: Rs 1,74,720 = 69

The work is carried out satisfactorily. Recommended for payment of Rs 1,74,720 = 0 after deduction of SD. Rounded to Rs 1,74,720 = 0.
